

Basalte x Gude

You can now optimise your Basalte Home installation with the power distribution strips from Gude.

A power distribution unit (PDU) is an extra device fitted with multiple outputs to distribute electric power. It is one of the most effective devices to protect your high-quality AV installations and solve problems in seconds. It's a piece of gear that does its magic behind the scenes, so not top-of-mind at all but it creates a highly valuable added value for your installations!

GUDE integrated into Basalte Home

After adding a PDU to your project, it will automatically be added to the Cloud platform. You can remotely detect a device failure in the installation of one of your clients and simply give a power cycle to a device. The problem is solved in a few seconds, no need to contact your clients.

GUDE's expert Power Control PDUs

The power distribution units (PDUs) from GUDE are power strips that can be installed in larger AV cabinets, often 19-inch racks, either horizontally or vertically. A PDU distributes power to various loads, such as servers and switches, and can have different types of device connectors: The most common are IEC C13, IEC C19 and grounding-type sockets.

About GUDE

GUDE has been a manufacturer of reliable power and monitoring solutions for over 30 years. It's a family-owned company that takes pride in creating quality products that optimize and expand infrastructures such as those found in networks, servers, and media racks. "Our solutions are designed and manufactured in Germany to meet customers' quality requirements for AV and IT infrastructure performance," says Philipp Gude. The company philosophy is built into its mission statement: "Our guiding principle: To delight customers and save time integrating products for AV and IT professionals. We build products that benefit AV and IT experts with less downtime, fast and easy integration, and increased operational reliability."
